FOREWORD

This manual provides information for the proper servicing of the 1960 Thunderbird. The descriptions and specifications contained in this manual were in effect at the time the manual was approved for printing. The Ford Division of Ford Motor Company reserves the right to discontinue models at any time, or change specifications or design, without notice and without incurring obligation.

FORD MOTOR COMPANY
THUNDERBIRD IDENTIFICATION

FIG. 1—Thunderbird Rating Plate

Figure 1 illustrates a Thunderbird rating plate and its elements. The rating plate is attached to the left door front pillar.

MODEL YEAR
The number “0” designates 1960.

ASSEMBLY PLANT
The letter “Y” designates the Lincoln plant at Wixom, Mich.

MODEL
71 .................................................. Tudor Hardtop
73 .................................................. Convertible

ENGINE
Y .................................................. 352 cubic inch V-8
J .................................................. 430 cubic inch 4V V-8

CONSECUTIVE UNIT NUMBER
The assembly plant, with each model year, begins with consecutive unit number 100001 and continues on for each unit built.

BODY
63A .................................................. Tudor Hardtop
76A .................................................. Convertible

COLOR
SOLID COLOR
A .................................................. Black
B .................................................. Dark Blue Metallic
C .................................................. Light Aqua
D .................................................. Medium Blue Metallic
E .................................................. Light Blue
F .................................................. Beige Metallic
G .................................................. Burgundy Metallic
H .................................................. Red
I .................................................. turquoise Metallic
J .................................................. Light Blue
K .................................................. Light Aqua
L .................................................. Beige Metallic
M .................................................. Medium Blue Metallic
N .................................................. White
O .................................................. Black
P .................................................. Light Gray Metallic
Q .................................................. White
R .................................................. Black
S .................................................. Beige Metallic
T .................................................. White
U .................................................. Black
V .................................................. Light Gray Metallic
W .................................................. White
X .................................................. Beige Metallic
Y .................................................. Light Aqua
Z .................................................. White

1960 THUNDERBIRD SHOP MANUAL

GROUP I

ENGINES AND EXHAUST SYSTEM

PART 1-1 GENERAL ENGINE SERVICE ................. 1-2

PART 1-2 THUNDERBIRD 352 SPECIAL V-8 ........... 1-20

PART 1-3 THUNDERBIRD 430 SPECIAL V-8 ........... 1-40

PART 1-4 EXHAUST SYSTEM .......................... 1-60

PART 1-5 SPECIFICATIONS ......................... 1-62
1 ENGINE TROUBLE DIAGNOSIS

Engine performance complaints usually fall under one of the basic headings listed in the "Engine Trouble Diagnosis Guide." This guide lists procedures and checks to be performed to help isolate the cause of the trouble. When a particular trouble can not be traced to a definite cause by a simple check, the possible items that could be at fault are listed in the order of their probable occurrence. Therefore, in most cases, the items should be checked in the order listed. For example, under Poor Acceleration, the ignition system is listed as a probable cause of the trouble. All the ignition system items that affect acceleration are listed. These items should all be checked before proceeding to the next probable cause listed.

ENGINE TROUBLE DIAGNOSIS GUIDE

<table>
<thead>
<tr>
<th>ENGINE WILL NOT CRANK</th>
<th>NO SPARK OR A WEAK SPARK AT THE SPARK PLUGS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Check the fuel supply. If there is sufficient fuel in the tank, the cause of the trouble probably lies in either the ignition or the fuel system. To determine which system is at fault, disconnect all the spark plug wires. Check the spark intensity of one wire at a time. Install a terminal adapter in the terminal of the wire to be checked. Hold the adapter approximately 3/8 inch from the exhaust manifold and crank the engine.</td>
<td>The cause of the trouble is in the ignition system. To determine if the cause of the trouble is in the primary or the secondary circuit, remove the coil high tension lead from the top of the distributor. Hold it approximately 3/8 inch from the cylinder head.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>ENGINE CRANKS NORMALLY, BUT WILL NOT START (Continued)</th>
<th>ENGINE STARTS, BUT FAILS TO KEEP RUNNING</th>
<th>FUEL SUPPLY AT CARBURETOR</th>
</tr>
</thead>
<tbody>
<tr>
<td>With the ignition on and the engine turning over, check for a spark.</td>
<td></td>
<td>Work the throttle by hand several times. Each time the throttle is actuated, fuel should spurt from the accelerating pump discharge nozzles.</td>
</tr>
<tr>
<td>If the spark at the coil high tension lead is good, the cause of the trouble is probably in the distributor cap, rotor, or the spark plug wires.</td>
<td></td>
<td>If fuel is discharged by the accelerating pump, the engine is probably flooded, or there is water in the fuel system, or an engine mechanical item, such as valves, is at fault.</td>
</tr>
<tr>
<td>If there is no spark or a weak spark at the coil high tension lead, the cause of the trouble is probably in the primary circuit, coil to distributor high tension lead, or the coil.</td>
<td></td>
<td>If fuel is not discharged by the accelerating pump, disconnect the carburetor fuel inlet line at the carburetor. Use a suitable container to catch the fuel. Crank the engine to see if fuel is reaching the carburetor.</td>
</tr>
</tbody>
</table>

**A GOOD SPARK AT THE SPARK PLUGS**

- If the spark is good at the spark plugs, check the spark plugs and the ignition timing. If the spark plugs or the ignition timing are not at fault, check the following items:

**AUTOMATIC CHOKE**

- Check the position of the choke plate. If the engine is hot, the plate should be open. If the plate is not open, the engine will load up due to the excessively rich mixture and will not start. If the engine is cold, the plate should be closed, if the plate is not operating properly, check the following items:

  - The choke linkage for binding.
  - The fast idle cam for binding.
  - Thermostatic spring housing adjustment.
  - Fast idle speed screw for proper adjustment.

**FUEL SYSTEM**

- Idle fuel mixture needles not properly adjusted.
- Engine idle speed set too low.
- The choke not operating properly.
- Float setting incorrect.
- Fuel inlet system not operating properly.
- Dirt or water in fuel lines, fuel filter, or carburetor.

**ENGINE RUNS, BUT MISSES**

- Determine if the miss is steady or erratic and at what speed the miss occurs by operating the engine at various speeds under load.

- Carburetor icing.
- Fuel pump defective.

**IGNITION SYSTEM**

- Breaker points not properly adjusted.
- Defective spark plugs.
- Leakage in the high tension wiring.

**MISSES STEADILY AT ALL SPEEDS**

- Isolate the miss by operating the engine with one cylinder not firing.
### ENGINE TROUBLE DIAGNOSIS GUIDE (Continued)

<table>
<thead>
<tr>
<th>ENGINE RUNS, BUT MISSES (Continued)</th>
<th>This is done by operating the engine with the ignition wire removed from one spark plug at a time, until all cylinders have been checked. Ground the spark plug wire removed. If the engine speed changes when a particular cylinder is shorted out, the cylinder was delivering power before being shorted out. If no change in the engine operation is evident, the miss was caused by that cylinder not delivering power before being shorted out. Check the:</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>IGNITION SYSTEM</strong></td>
<td>If the miss is isolated in a particular cylinder, perform a spark test on the ignition lead of the cylinder. If a good spark does not occur, the trouble is in the secondary circuit of the system, check the: Spark plug wire. Distributor cap. If a good spark occurs, check the spark plug. If the spark plug is not at fault, a mechanical component of the engine is probably at fault.</td>
</tr>
<tr>
<td><strong>ENGINE</strong></td>
<td>Perform a compression test to determine which mechanical component of the engine is at fault.</td>
</tr>
<tr>
<td><strong>MISSES ERRATICALLY AT ALL SPEEDS</strong></td>
<td></td>

<tr>
<td><strong>EXHAUST SYSTEM</strong></td>
<td>Exhaust gas control valve inoperative or sticking—352 engine. Exhaust system restricted.</td>
</tr>
<tr>
<td><strong>IGNITION SYSTEM</strong></td>
<td>Breaker points not properly adjusted. Defective breaker points, condenser, secondary wiring, coil, or spark plugs. High tension leakage across the coil, rotor, or distributor cap.</td>
</tr>
<tr>
<td><strong>FUEL SYSTEM</strong></td>
<td>Choke not operating properly. Float setting incorrect.</td>
</tr>
<tr>
<td><strong>ROUGH ENGINE IDLE</strong></td>
<td>Fuel inlet system not operating properly. Dirt or water in fuel lines, fuel filter, or carburetor.</td>
</tr>
</tbody>
</table>

**COOLING SYSTEM**
Check the cooling system for internal leakage and/or for a condition that prevents the engine from reaching normal operating temperature.

**ENGINE**
Perform a compression test to determine which mechanical component of the engine is at fault.

**MISSES AT IDLE ONLY**

**FUEL SYSTEM**
Idle fuel mixture needles not properly adjusted.

**IGNITION SYSTEM**
Defective coil, condenser, breaker points, rotor, ignition wiring, or spark plugs.
Excessive play in the distributor shaft.
Worn distributor cam.

**VACUUM BOOSTER PUMP**
Leaking pump, lines, or fittings.

**ENGINE**
Perform a compression test to determine which mechanical component of the engine is at fault.

**MISSES AT HIGH SPEED ONLY**

**FUEL SYSTEM**
Power valve clogged or damaged—Ford carburetor.
Vacuumer not operating properly—Carter carburetor.
Low or erratic fuel pump pressure. Fuel inlet system not operating properly.
Restricted fuel filter.

**COOLING SYSTEM**
Engine overheating.

**FUEL SYSTEM**  
Engine idle speed set too low.  
Idle fuel mixture needles not properly adjusted.  
Float setting incorrect.  
Air leaks between the carburetor and the manifold and/or fittings.

Fuel leakage at the carburetor fuel bowls.  
Idle fuel system air bleeds or fuel passages restricted.  
Fuel bleeding from the accelerating pump discharge nozzles.  
Throttle plates not closing.  
Improper secondary throttle plate stop adjustment—Ford carburetor.
## Engine Trouble Diagnosis Guide (Continued)

### Rough Engine Idle (Continued)

**IGNITION SYSTEM**
- Improperly adjusted or defective breaker points.
- Fouled or improperly adjusted spark plugs.
- Incorrect ignition timing.
- Spark plug misfiring.

**Exhaust System**
- Exhaust gas control valve inoperative or sticking—352 engine.

**Vacuum Booster Pump**
- Leaking pump, lines, or fittings.

**Engine**
- Loose engine mounting bolts or worn insulator.
- Cylinder head bolts not properly tightened.
- Intake manifold seals leaking—352 engine.

### Poor Acceleration

**Ignition System**
- Incorrect ignition timing.
- Fouled or improperly adjusted spark plugs.
- Improperly adjusted or defective breaker points.
- Distributor not advancing properly.

**Fuel System**
- Inoperative accelerating pump inlet.
- Inoperative accelerating pump discharge ball check.
- Accelerating pump diaphragm or piston defective.
- Float setting incorrect.
- Throttle linkage not properly adjusted.
- Accelerating pump stroke not properly adjusted.

**Exhaust System**
- Exhaust gas control valve inoperative or sticking—352 engine.

**Brakes**
- Improper adjustment.

**Transmission**
- Clutch slippage—manual-shift transmissions.
- Improper band adjustment—automatic transmissions.
- Converter one-way clutch—automatic transmission.

### Engine Does Not Develop Full Power, or Has Poor High Speed Performance

**Preliminary**
- Determine if the trouble exists when the engine is cold, at normal operating temperature, or at all engine temperatures.

**Engine Cold**

**Exhaust System**
- Exhaust gas control valve inoperative or sticking—352 engine.

**Fuel System**
- Clogged or undersize main jets and/or low float setting.
- Clogged or undersize secondary jets.

**Cooling System**
- Thermostats inoperative or incorrect heat range.

**Engine at Normal Operating Temperature**

**Exhaust System**
- Exhaust gas control valve inoperative or sticking—352 engine.

**Transmission**
- Power valve clogged or damaged.
- Secondary throttle plates not opening.
- Fuel pump pressure incorrect.
- Distributor vacuum passage in the carburetor blocked.
- Restricted fuel filter.

</tr>
<tr>
<td>If the test indicates that the fuel consumption is excessive, make a preliminary check of the following items before proceeding to the fuel and ignition systems.</td>
</tr>
</tbody>
</table>

**PRELIMINARY CHECKS**

**CHASSIS ITEMS**

Check:
- Tires for proper pressure. 
- Front wheel alignment. 
- Brake adjustment. 

**EXHAUST SYSTEM**

Check the exhaust gas control valve operation—352 engine. 

**ODOMETER**

Check calibration. 

**IGNITION SYSTEM**

Check ignition timing.  

**FINAL CHECKS**

**FUEL SYSTEM**

Check:
- Fuel pump pressure. 
- Engine idle speed. 

- Idle fuel mixture needles for proper adjustment. 
- Automatic choke for proper operation. 
- Fast idle speed screw for proper adjustment. 
- Accelerating pump stroke adjustment. 
- Anti-stall dashpot for proper adjustment. 
- Air cleaner for restrictions. 
- Float setting or fuel level. 
- Jets for wear and/or damage. 
- Power valve or Vacuumer operation. 
- Air bleeds for obstructions. 
- Accelerating pump discharge nozzles for siphoning. 

**IGNITION SYSTEM**

Check:
- Ignition timing. 
- Spark plug condition and adjustment. 
- Distributor spark advance operation. 

**ENGINE**

Perform an engine compression test to determine which mechanical component of the engine is at fault. 

**COOLING SYSTEM**

Check thermostat operation and heat range. 

**TRANSMISSION**

Check band adjustment (automatic transmissions).
**ENGINE TROUBLE DIAGNOSIS GUIDE (Continued)**

<table>
<thead>
<tr>

<td>Intake manifold to cylinder head gasket defective. Improper tightening of cylinder head or intake manifold bolts. Cylinder block core plugs leaking. Temperature sending unit leaking. Cracked cylinder head or block, or warped cylinder head or block gasket surface.</td>
</tr>
<tr>
<td>NOISY HYDRAULIC VALVE LIFTER</td>
<td>A noisy valve lifter can be located by operating the engine at idle speed and placing a finger on the face of the valve spring retainer. If the lifter is not functioning properly, a shock will be felt when the valve seats. Another method of identifying a noisy lifter is by the use of a piece of hose. With the engine operating at idle speed, place one end of the hose near the end of the valve stem and the other end to the ear and listen for a metallic noise. Repeat this procedure on each intake and exhaust valve until the noisy lifter(s) has been located. The most common causes of hydraulic valve lifter troubles are dirt, gum, varnish, carbon deposits, and air bubbles. Dirt in the lifter assembly can prevent the disc valve from seating, or it may become lodged between the plunger and body surfaces. In either case, the lifter becomes inoperative due to failure to “pump-up,” or because the internal parts are no longer free to function properly. When dirt is found to be responsible for lifter malfunction, remove the lifter assembly and thoroughly clean it. Recommended engine oil and filter change intervals should be followed to minimize lifter problems caused by dirt. Deposits of gum and varnish cause similar conditions to exist which may result in lifter malfunction. If these conditions are found to be present, the lifter should be disassembled and cleaned in solvent to remove all traces of deposits. Air bubbles in the lubricating oil, caused by an excessively high or low oil level, may likewise cause lifter malfunction. A damaged oil pick up tube may allow air to be drawn into the lubricating system. To check for the presence of air, remove a valve rocker arm shaft cover and note the condition of the oil as it flows from the valve rocker arm shaft assembly. Perform corrective action as required to remove air from the lubricating oil.</td>
<td></td>
</tr>
</tbody>
</table>

## TUNE-UP

The Tune-Up Schedule (Table 1) is applicable for either a minor or major tune-up. Refer to the "Maintenance Guide" in Group 17 for the proper mileage interval for minor tune-up and major tune-up. Refer to that part of the manual which describes, in detail, the procedure to be followed. Perform the operations in the sequence listed.

3 TESTS AND ADJUSTMENTS—ENGINE INSTALLED

CAMSHAFT LOBE LIFT

1. Remove the valve rocker arm shaft assembly and install a solid tappet-type push rod in the push rod bore of the camshaft lobe to be checked.

2. Make sure the push rod is in the lifter push rod cup. Install a dial indicator in such a manner as to have the actuating point of the indicator in the push rod socket and in the same plane as the push rod movement (Fig. 1).

3. Turn the crankshaft damper slowly in the direction of rotation until the lifter is on the base circle of the camshaft lobe. At this point, the push rod will be in its lowest position.

4. Zero the dial indicator.

5. Continue to rotate the damper slowly until the push rod is in the fully raised position.

6. Compare the total lift recorded on the indicator with specifications.

7. To check on the accuracy of the original indicator reading, continue to rotate the crankshaft until the indicator reads zero.

VALVE CLEARANCE

A 0.060-inch shorter push rod (color coded white) or a 0.060-inch longer push rod (color coded yellow) are available for service to provide a means of compensating for dimensional changes in the valve mechanism. Valve stem to valve rocker arm clearance should be 0.078-0.218 inch with the hydraulic lifter completely collapsed. Repeated valve reconditioning operations (valve and/or valve seat refacing) will decrease this clearance to the point that if not compensated for, the hydraulic valve lifter will cease to function.

The correct operating range of the hydraulic valve lifter plunger must be maintained because:

If the plunger travel is excessive, the lifter pump-up time will be prolonged resulting in excessive valve train noise following engine start-up. If the travel is insufficient to compensate for normal expansion of the valve operating components, the valve would not be permitted to seat properly resulting in a rough engine and/or premature valve failure.

FIG. 1—Camshaft Lobe Lift

To check the valve clearance:

1. Position the crankshaft as outlined in Steps 5 and 6.

2. Install the hydraulic lifter compressor tool on the rocker arm and slowly apply pressure to bleed down the hydraulic lifter until the plunger is completely bottomed (Fig. 2). Hold the lifter in the fully collapsed position.

3. Insert the correct end of the clearance gauge between the valve stem and the rocker arm of the valve being checked.

4. If the first step of the gauge enters, a standard length push rod may be used.

If the first step of the gauge does not enter, replace the standard push rod with a 0.060-inch shorter push rod.

If the second step of the gauge enters, the operating range of the lifter is excessive. This indicates that

the incorrect push rod has been installed or severe wear has occurred at the push rod ends, rocker arm, or valve stem. In this case, it will be necessary to determine the area of discrepancy and the incorrect or defective part(s) replaced.

If all the valve train components except the push rod are within limits, install a 0.060-inch longer push rod.

5. Rotate the crankshaft until No. 1 piston is on T.D.C. at the end of the compression stroke. With No. 1 piston on T.D.C., check the following valves:

- No. 1 Intake
- No. 3 Intake
- No. 7 Intake
- No. 8 Intake
- No. 2 Exhaust
- No. 4 Exhaust
- No. 5 Exhaust
- No. 6 Exhaust

6. Position No. 6 piston on T.D.C. and check the following valves:

- No. 2 Intake
- No. 4 Intake
- No. 5 Intake
- No. 6 Intake

When compressing the valve spring to remove push rods, be sure the piston in the individual cylinder is below T.D.C. to avoid contact between the valve and the piston.

To replace a push rod, it will be necessary to remove the valve rocker arm shaft assembly.

Upon replacement of a valve push rod and/or valve rocker arm shaft assembly, the engine should not be cranked or rotated until the hydraulic lifters have had an opportunity to leak down to their normal operating position. The leak down rate can be accelerated by using the tool shown in Fig. 2 on the valve rocker arm, applying pressure in a direction to collapse the lifter.

MANIFOLD VACUUM TEST

A manifold vacuum test aids in determining the condition of an engine and also helping to locate the cause of poor engine performance. To test manifold vacuum:

1. Operate the engine for a minimum of 30 minutes at 1200 rpm.

2. Install an accurate, sensitive vacuum gauge on the intake manifold vacuum line or on the fitting in the intake manifold.

3. Operate the engine at recommended idle rpm.

4. Check the vacuum reading on the gauge.
**TEST CONCLUSIONS**

Manifold vacuum is affected by carburetor adjustment, valve timing, the condition of the valves, cylinder compression, and leakage of the manifold, carburetor, or cylinder head gaskets.

Because abnormal gauge readings may indicate that more than one of the above factors is at fault, exercise caution in analyzing an abnormal reading. For example, if the vacuum is low, the correction of one item may increase the vacuum enough to indicate that the trouble has been corrected. It is important, therefore, that each cause of an abnormal reading be investigated and further tests conducted where necessary in order to arrive at the correct diagnosis of the trouble.

Table 2 lists various types of readings and their possible causes.

Allowance should be made for the effect of altitude on the gauge reading. The engine vacuum will decrease with an increase in altitude.

**ENGINE COMPRESSION TEST**

1. Be sure the battery is properly charged. Operate the engine for a minimum of 30 minutes at 1200 rpm. Turn the ignition switch off, then remove all the spark plugs.

2. Set the primary throttle plates and the choke plate in the wide open position.

3. Install a compression gauge in No. 1 cylinder.

4. Crank the engine several times and record the highest reading registered. Note the number of compression strokes required to obtain the highest reading.

5. Repeat the test on each cylinder, cranking the engine the same number of times for each cylinder as was required to obtain the highest reading on No. 1 cylinder.

**TEST CONCLUSIONS**

A variation of $\pm 20$ pounds from specified pressure is satisfactory. However, the compression of all cylinders should be uniform within 10 pounds.

A reading of more than the allowable tolerance above normal indicates excessive deposits in the cylinder.

A reading of more than the allowable tolerance below normal indicates leakage at the cylinder head gasket, piston rings, or valves.

To determine whether the rings or the valves are at fault, squirt the equivalent of a tablespoon of heavy oil into the combustion chamber, then crank the engine to distribute the oil and repeat the compression test. The oil will temporarily seal leakage past the rings. If approximately the same reading is obtained, the rings are satisfactory, but the valves are leaking. If the compression has increased 10 pounds or more over the original reading, there is leakage past the rings.

During a compression test, if the pressure fails to climb steadily and remains the same during the first two successive strokes, but climbs higher on the succeeding strokes, or fails to climb during the entire test, it indicates a sticking or stuck valve.

**TABLE 2—Manifold Vacuum Gauge Readings**

<table>

**CLEANING, INSPECTION, AND RECONDITIONING**

**INTAKE MANIFOLD**

Clean the manifolds in a suitable solvent, then dry them with compressed air.

On the 352 engine, scrape all carbon deposits from the center exhaust passage below the carburetor heat riser. This carbon acts as an insulator restricting the heating action of the hot exhaust gases.

Inspect the manifold for cracks, leaks, or other defects that would make it unfit for further service. Replace all studs that are stripped or otherwise damaged. Remove all filings and foreign matter that may have entered the manifold as a result of repairs.

On the 352 engine, check the baffle plate on the underside of the manifold for looseness and be sure the maze screen is in place. Clean off any varnish accumulation.

**EXHAUST MANIFOLD**

Inspect the manifolds for cracks, leaks, or other defects that would make them unfit for further service.

On the right exhaust manifold of the 352 engine, clean out the automatic choke air heat chamber (Fig.
3. Make sure the air inlet and outlet holes are completely open and the cover does not leak. Blow out the automatic choke air heat tube with compressed air.

**VALVE ROCKER ARM SHAFT ASSEMBLY**

Clean all the parts thoroughly. Make sure that all oil passages are open.

**FIG. 4—Push Rod Runout**

Check the clearance between each rocker arm and the shaft by checking the I.D. of the rocker arm bore and the O.D. of the shaft. If the clearance between any rocker arm and the shaft exceeds the wear limit, replace the shaft and/or the rocker arm. Inspect the shaft and the rocker arm bore for nicks, scratches, scores, or scuffs. Dress up minor surface defects with a hone.

Inspect the pad at the valve end of the rocker arms for a grooved radius. If the pad is grooved, replace the rocker arm. Do not attempt to true this surface by grinding.

Check for broken locating springs.

**PUSH RODS**

Check the ends of the push rods for nicks, grooves, roughness, or excessive wear.

The push rods can be visually checked for straightness while they are installed in the engine by rotating them with the valve closed. They also can be checked with a dial indicator (Fig. 4). If the runout exceeds the maximum limit at any point, discard the rod. Do not attempt to straighten push rods.

**CYLINDER HEADS**

**CLEANING AND INSPECTION**

With the valves installed to protect the valve seats, remove deposits from the combustion chambers (352 engine) and valve heads with a scraper and a wire brush. Be careful not to scratch the cylinder head gasket surface. After the valves are removed, clean the valve guide bores with a valve guide cleaning tool. Use cleaning solvent to remove dirt, grease, and other deposits.

Check the cylinder head for cracks, and the gasket surface for burrs and nicks. Replace the head if it is cracked. Do not plane or grind more than 0.010 inch from the cylinder head gasket surface. Remove all burrs or scratches with an oil stone.

**CYLINDER HEAD FLATNESS**

Check the flatness of the cylinder head gasket surface (Fig. 5).
When going from a standard size valve to an oversize valve, always use the reamers in sequence. Always reface the valve seat after the valve guide has been reamed.

**REFACING VALVE SEATS**

Refacing of the valve seats should be closely co-ordinated with the refacing of the valve face so that the finished seat will match the valve face and be centered. This is important so that the valve and seat will have a good compression tight fit. Be sure that the refacer grinding wheels are properly dressed.

Grind the exhaust valve seats of both engines and the intake valve seats of the 430 engine to a true 45° angle (Fig. 9). Grind the intake valve seat of the 352 engine to a true 30° angle (Fig. 10). Remove only enough stock to clean up pits, grooves, or to correct the valve seat runout. After the seat has been refaced, measure the seat width (Fig. 7). Narrow the seat, if necessary, to bring it within limits.

If the valve seat width exceeds the maximum limits, remove enough stock from the top edge and/or bottom edge of the seat to reduce the width to specifications (Fig. 9 or 10).

On the exhaust valve seats of both engines and the intake valve seats of the 430 engine, use a 60° angle grinding wheel to remove stock from the bottom of the seats (raise the seats) and use a 30° angle wheel to remove stock from the top of the seats (lower the seats).

On the intake valve seats of the 352 engine, use a 15° angle grinding wheel to remove stock from the top of the seats (lower the seats).

The finished valve seat should contact the approximate center of the valve face. To determine where the valve seat contacts the face, coat the seat with Prussian blue, then set the valve in place. Rotate the valve with light pressure. If the blue is transferred to the center of the valve face, the contact is satisfactory. If the blue is transferred to the top edge of the valve face, lower the valve seat. If the blue is transferred to the bottom edge of the valve face, raise the valve seat.

Inspect the stem for a bent condition and the end of the stem for grooves or scores. Check the valve head for signs of burning or erosion, warpage, and cracking. Defects, such as minor pits, grooves, etc. may be removed. Discard valves that are severely damaged.

**VALVE FACE RUNOUT**

Check the valve face runout (Fig. 12). It should not exceed the wear limit.

**VALVE STEM CLEARANCE**

Check the valve stem to valve guide clearance of each valve in its respective valve guide with the tool shown in Fig. 13 or its equivalent. If the clearance exceeds the wear limit, try a new valve.
**VALVE SPRING PRESSURE**

Check the spring for proper pressure (Fig. 14). Do not remove the damper spring from the 430 engine when checking the pressure. Weak valve springs cause poor engine performance; therefore, if the pressure of any spring exceeds the wear limit, replace the spring.

Do not remove more than 0.010 inch from the stem.

After refacing the valves, it is good practice to lightly lap in the valves with a medium grade lapping compound to match the seats. Be sure to remove all the compound from the valve and seat after the lapping operation.

**SELECT FITTING VALVES**

If the valve stem to valve guide clearance exceeds the wear limit, ream the valve guide for the next oversize valve stem. Valves with oversize stem diameters of 0.003, 0.015, and 0.030 inch are available for service. Always reface the valve seat after the valve guide has been reamed.

**HYDRAULIC VALVE LIFTERS**

The lifter assemblies should be kept in proper sequence so they can be installed in their original position. Inspect and test each lifter separately so as not to intermix the internal parts. If any part of the lifter assembly needs replacing, replace the entire assembly.

**CLEANING AND INSPECTION**

Thoroughly clean all the parts in clean solvent and wipe them with a clean, lint free cloth.

Inspect the parts and discard the entire lifter assembly if any part shows signs of pitting, scoring, galling, or evidence of non-rotation. Also, replace the entire assembly if the plunger is not free in the body. The plunger should drop to the bottom of the body by its own weight.

Assemble the lifter assembly and check the assembly for freeness of operation by pressing down on the push rod cup. Also, the lifter assemblies can be tested with a hydraulic valve lifter tester to test the leak down rate. The leak down rate specification is 8-45 seconds. Follow the instructions of the test unit manufacturer.

**ROCKER ARM TO VALVE CLEARANCE**

If the valve and/or valve seat have been refaced, it will be necessary to check the clearance between the rocker arm pad and the valve stem with the valve train assembly installed in the engine (Page 1-9).

**TIMING CHAIN**

Clean all parts in solvent and dry them with compressed air. Inspect the chain for broken links and the sprockets for cracks, and worn or damaged teeth. It is recommended that all the components be replaced if any one item needs replacement.

**CAMSHAFT AND BEARINGS**

Clean the camshaft in solvent and wipe dry. Inspect the camshaft lobes for scoring, and signs of abnormal wear. Lobe wear characteristics may result in pitting in the general area of the nose portion of the lobe. This pitting is not detrimental to the operation of the camshaft, therefore, the camshaft should not be replaced until the lobe lift loss has exceeded 0.005 inch.

The lift of camshaft lobes can only be accurately checked with the camshaft installed in the engine. Refer to “Camshaft Lobe Lift” in Section 3 of this part.

Check the camshaft journal to bearing clearances by measuring the diameter of the journals and the I.D. of the bearings. If the clearance exceeds the wear limit, the camshaft journals should be refinished for undersized bearings or the camshaft replaced, and/or the bearings should be replaced. Bearings are available prefinished to size for standard and 0.015-inch undersize journal diameters.

Check the distributor drive gear for broken or chipped teeth.

Remove light scuffs, scores, or nicks from the camshaft machined surfaces with a smooth oilstone.

**CRANKSHAFT**

**CLEANING AND INSPECTION**

Handle the crankshaft with care to avoid possible fractures or damage to the finished surfaces. Clean the crankshaft with solvent, then blow out all oil passages with compressed air.

Inspect main and connecting rod journals for cracks, scratches,
grooves, or scores. Dress minor imperfections with an oilstone. Refinish severely marred journals.

Measure the diameter of each journal in at least four places to determine out-of-round, taper, or undersize condition (Fig. 16).

If the journals exceed the wear limit, they should be refinished to size for the next undersize bearing.

**REFINISHING JOURNALS**

Refinish the journal to give the proper clearance with the next undersize bearing. If the journal will not “clean up” to give the proper clearance with the maximum undersize bearing available, replace the crankshaft.

Always reproduce the same journal shoulder radius that existed originally. Too small a radius will result in fatigue failure of the crankshaft. Too large a radius will result in bearing failure due to radius ride of the bearing.

Twisted connecting rods will not create an easily identifiable wear pattern, but badly twisted rods will disturb the action of the entire piston, rings, and connecting rod assembly and may be the cause of excessive oil consumption.

**CLEANING AND INSPECTION**

Remove the bearings from the rod and cap. Identify the bearings if they are to be used again.

Clean the connecting rod in solvent, including the rod bore and the back of the inserts. Do not use a caustic cleaning solution. Blow out all passages with compressed air.

Inspect the connecting rods for signs of fractures and the bearing bores for out-of-round and taper. If the bore exceeds the recommended limits and/or if the connecting rod is fractured, it should be replaced.

On a 352 engine, check the piston pin to connecting rod bushing clearance. Replace the connecting rod if the bushing is so worn that it cannot bereamed or honed for an oversize pin.

On a 430 engine, check the I. D. of the connecting rod piston pin bore and the O. D. of the piston pin. Replace the connecting rod if the pin bore is not within specifications. Replace the piston and pin if the pin is not within specifications. To check the interference fit of the pin in the connecting rod, refer to Part 1-3.

Replace defective connecting rod nuts and bolts.

After the connecting rods are assembled to the piston, check the connecting rods for bend or twist on a suitable alignment fixture. Follow the instructions of the fixture manufacturer. If the bend and/or twist is excessive, the connecting rod should be straightened or replaced.

**PISTONS, PINS, AND RINGS**

**CLEANING AND INSPECTION**

Remove deposits from the piston surfaces and from the underside of the piston head. Clean gum or varnish from the piston skirt, piston pins, and rings with solvent. Do not use a caustic cleaning solution or a wire brush to clean pistons. Clean the ring grooves with a ring groove cleaner (Fig. 17). Make sure the oil ring slots (or holes) are clean.

Carefully inspect the pistons for fractures at the ring lands, skirts, and pin bosses, and for scuffed, rough, or scored skirts. If the lower inner portion of the ring grooves have high steps, replace the piston.

The step will interfere with ring operation and cause excessive ring side clearance.

Spongy, eroded areas near the edge of the top of the piston are usually caused by detonation, or pre-ignition. A shiny surface on the thrust surface of the piston, offset from the centerline between the piston pin holes, can be caused by a bent connecting rod. Replace pistons that show signs of excessive wear, wavy ring lands, fractures, and/or damage from detonation or pre-ignition.

Check the piston to cylinder bore clearance with a tension scale and ribbon (covered under “Fitting Pistons”) and the ring side clearance (covered under “Fitting Piston Rings”).

Replace piston pins showing signs of fracture or etching and/or wear.

On a 352 engine, check the piston pin fit in the piston and rod bushing.

To check the pin fit in the connecting rod of a 430 engine, refer to Part 1-3.

Replace all rings that are scored, chipped, or cracked. Check the end gap and side clearance. It is good practice to always install new rings when overhauling the engine. Rings should not be transferred from one piston to another regardless of mileage.

**FITTING PISTONS**

Pistons are available for service in standard sizes and 0.020, 0.030, 0.040, and 0.060-inch oversize. Standard size pistons are divided into two sizes and are identified by a dab of red or blue paint. Refer to Part 1-5 for the available sizes.

The piston to cylinder bore clearance should be from 0.0011-0.0029 inch (352 engine) or 0.0008—0.0026 inch (430 engine). The wear limit is 0.005 inch.

If the clearance is greater than the maximum limit, recheck calculations to be sure that the proper size piston has been selected, check for a dam-
aged piston, then try a new piston. If the clearance is less than the minimum limit, recheck calculations before trying another piston. If none can be fitted, refinish the cylinder for the next size piston.

**When a piston has been fitted, mark it for assembly in the cylinder to which it was fitted.**

If the taper and out-of-round conditions of the cylinder bore are within limits, new piston rings will give satisfactory service provided the piston clearance in the cylinder bore is within limits. If the new rings are to be installed in a used cylinder that has not been refinished, remove the cylinder wall "glaze."

**To fit a piston:**

1. Calculate the size piston to be used by taking a cylinder bore check (Fig. 25).
2. Select the proper size piston to provide the desired clearance. Make sure the piston and cylinder bore are at room temperature (70°F). After any refinishing operation, allow the cylinder bore to cool and make sure the piston and bore are clean and dry before the piston fit is checked.
3. Attach a tension scale to the end of a feeler gauge ribbon that is free of dents or burrs. The feeler ribbon should be 1/8 inch wide and of one of the thicknesses listed in Table 3.
4. Position the ribbon in the cylinder bore so that it extends the entire length of the piston at 90° from the piston pin location.

**TABLE 3—Piston Clearance**

<table>
<thead>
<tr>
<th>RING GAUGE PULL IN POUNDS</th>
<th>CLEARANCE IN INCHES</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.0008</td>
<td>.0026</td>
</tr>
<tr>
<td>0.0015 RIBBON</td>
<td>.002</td>
</tr>
<tr>
<td>0.0025 RIBBON</td>

</tr>
<tr>
<td>0.0035 RIBBON</td>
<td>.004</td>
</tr>
<tr>
<td>0.004 RIBBON</td>
<td>.005</td>
</tr>
</tbody>
</table>

**Example 1.** If a 0.0015-inch feeler ribbon is used and it takes approximately 4 3/4 pounds pull to remove the feeler ribbon, the resultant clearance is approximately 0.0008 inch.

**Example 2.** If a 0.003-inch feeler ribbon is used and it takes approximately 9 pounds pull to remove the ring, the resultant clearance is approximately 0.0015 inch.

**Example 3.** If a 0.003-inch feeler ribbon is used and it takes approximately 4 pounds pull to remove the feeler ribbon, the resultant clearance is approximately 0.0026 inch.

**FITTING PISTON RINGS**

1. Select the proper ring set for the size piston to be used.
2. Position the ring in the cylinder bore in which it is going to be used.
3. Push the ring down into the cylinder bore area where normal ring wear is not encountered.
4. Use the head of a piston to position the ring so that the ring is square with the cylinder wall. Use caution to avoid damage to the ring or cylinder bore.

5. Measure the gap between the ends of the ring with a feeler gauge (Fig. 19). If the gap is less than the recommended lower limit, try another ring set.

6. Check the ring side clearance of the compression rings with a feeler gauge inserted between the ring and its lower land (Fig. 20). The gauge should slide freely around the entire ring circumference without binding. Any wear that occurs will form a step at the inner portion of the lower land. If the lower lands have high steps, the piston should be replaced.

**MAIN AND CONNECTING ROD BEARINGS**

**CLEANING AND INSPECTION**

Clean the bearing inserts and caps thoroughly. Inspect each bearing carefully. Bearings that have a scored, chipped, or worn surface should be replaced. Typical examples of bearing failure and their causes are shown in Fig. 21. Check the clearance of bearings that appear to be satisfactory with Plastigage. Fit new bearings following the recommended procedure.

**BEARING REPLACEMENT**

The main and connecting rod bearing inserts are selective fit and do not require reaming to size upon installation. Do not file or lap bearing caps or use shims to obtain the proper bearing clearance.

Selective fit bearings are available for service in standard sizes only. Standard bearings are divided into two sizes and are identified by a daub of red or blue paint. Refer to Part 1-5 for the available sizes. Red marked bearings increase the clearance; blue marked bearings decrease the clearance. Undersized bearings, which are not selective fit, are available for use on journals that have been refinished.

Normally, bearing journals wear evenly and are not out-of-round. However, if a bearing is being fitted to an out-of-round journal, be sure to fit the bearing to the maximum diameter of the journal. If the bearing is fitted to the minimum diameter with maximum clearance, interference may result, causing an early failure. It is not recommended that bearings be fitted to a crankshaft journal which exceeds the maximum out-of-round specifications. When replacing standard bearings with new bearings, it is good practice to first try to obtain the proper clearance with two blue bearing halves.

When checking the width of the Plastigage, check at the widest point in order to get the minimum clearance. Check at the narrowest point in order to get the maximum clearance. The difference between the two readings is the taper.

If the clearance is less than the specified limits, try two red bearing halves or a combination of red and blue depending upon the condition. If the standard bearings do not bring the clearance within the desired limits, refinish the crankshaft journal, then install undersize bearings. Do not get foreign matter under the inserts. In time the foreign matter may distort the bearing and cause bearing failure.

**Main Bearings—Engine Installed**

1. Replace one bearing at a time, leaving the other bearings securely fastened. Remove the main bearing cap to which new bearings are to be installed.

2. Insert the upper bearing removal tool (tool 6331) in the oil hole in the crankshaft.

3. Rotate the crankshaft in the direction of engine rotation to force the bearing out of the block.

4. To install the upper main bearing, place the plain end of the bearing over the shaft on the locking tang side of the block. Using tool 6331 in the oil hole in the crankshaft, rotate the crankshaft in the opposite direction of engine rotation until the bearing seats itself. Remove the tool.

5. Replace the cap bearing.

6. Clean the crankshaft journal and bearing inserts.

7. Support the crankshaft so its weight will not compress the Plasti-
those bearings that are to be replaced.
2. Follow steps 4 thru 6 under "Main Bearings—Engine Installed."
3. Place a piece of Plastigage on the crankshaft journal, the full width of the journal and about ¼ inch off center (Fig. 23).
4. Follow steps 9 thru 12 under "Main Bearings—Engine Installed."

Connecting Rod Bearings.
1. Install the new bearings in the connecting rod and cap.
2. Pull the connecting rod assembly down firmly on the crankshaft journal.
3. Place a piece of Plastigage on the lower bearing surface, the full width of the cap and about ¼ inch off center.
4. Install the cap and tighten the connecting rod nuts to specifications. Do not turn the crankshaft while the Plastigage is in place.
5. Remove the cap, then using the Plastigage scale check the width of the Plastigage.
6. After the bearing clearance has been checked and found to be satisfactory, apply a light coat of engine oil to the journal and bearings, then install the connecting rod cap.
7. Repeat the procedure for the remaining connecting rods that require new bearings.

FLYWHEEL—MANUAL-SHIFT TRANSMISSIONS

INSPECTION
Inspect the flywheel for cracks, heat check, or other defects that would make it unfit for further service. Machine the friction surface of the flywheel if it is scored or worn. If it is necessary to remove more than 0.045 inch of stock from the original thickness, replace the flywheel.
Inspect the ring gear for worn, chipped, or cracked teeth. If the teeth are damaged, replace the ring gear.
With the flywheel installed on the crankshaft, check the flywheel face runout.

FLYWHEEL FACE RUNOUT
Install a dial indicator so that the indicator point bears against the flywheel face (Fig. 24). Turn the flywheel, making sure that it is full forward or rearward so that crankshaft end play will not be indicated as flywheel runout.
If the runout exceeds the maximum limit, remove the flywheel and check for burrs between the flywheel and the face of the crankshaft mounting flange. If no burrs exist, check the runout of the crankshaft mounting flange. Replace the flywheel or machine the crankshaft flywheel face if the mounting flange runout is excessive.

RING GEAR REPLACEMENT
Heat the defective ring gear with a blow torch on the engine side of the gear, then knock it off the flywheel. Do not hit the flywheel when removing the ring gear.
Heat the new ring gear evenly until the gear expands enough to slip onto the flywheel. Make sure the gear is seated properly against the shoulder. Do not heat any portion of the gear to a temperature higher than 500°F. If this limit is exceeded, the temper will be removed from the ring gear teeth.

FIG. 24—Flywheel Face Runout

CYLINDER BLOCK

During the disassembly of the cylinder block for engine overhaul, closely inspect the wear pattern on all parts to help diagnose the cause of wear.

CLEANING AND INSPECTION
Thoroughly clean the block in solvent. Remove old gasket material from all machined surfaces. Remove all pipe plugs which seal oil passages, then clean out all the passages. Blow out all passages, bolt holes, etc. with compressed air. Make sure the threads in the cylinder head bolt holes are clean. Dirt in the threads may cause binding and result in a false torque reading. Use a tap to true-up threads and to remove any deposits.
After the block has been thoroughly cleaned, make a check for cracks. Minute cracks not visible to
the naked eye may be detected by coating the suspected area with a mixture of 25% kerosene and 75% light motor oil. Wipe the part dry and immediately apply a coating of zinc oxide dissolved in denatured alcohol. If cracks are present, the coating will become discolored at the defective area. Replace the block if it is cracked.

Check all machined gasket surfaces for burrs, nicks, scratches, and scores. Remove minor imperfections with an oil stone. Check the flatness of the cylinder block gasket surface following the procedure and specifications recommended for the cylinder head.

Replace all expansion-type plugs that show evidence of leakage.

Inspect the cylinder walls for scoring, roughness, or other signs of wear. Check the cylinder bore for out-of-round and taper. Measure the bore with an accurate gauge following the instructions of the manufacturer. Measure the diameter of each cylinder bore at the top, middle, and bottom with the gauge placed at right angles and parallel to the centerline of the engine (Fig. 25).

**FIG. 25—Cylinder Bore Out-of-Round and Taper**

Refinish cylinders that are deeply scored and/or when out-of-round and/or taper exceed the wear limits.

If the cylinder walls have minor surface imperfections, but the out-of-round and taper are within limits, it may be possible to remove the imperfections by honing the cylinder walls and installing new service piston rings providing the piston clearance is within limits. Use the finest grade of honing stone for this operation.

**REFINISHING CYLINDER WALLS**

Honing is recommended for refinishing cylinder walls only when the walls have minor imperfections, such as light scuffs, scratches, etc. The grade of hone to be used is determined by the amount of metal to be removed. Follow the instructions of the hone manufacturer. If coarse stones are used to start the honing operation, leave enough material so that all hone marks can be removed with the finishing hone which is used to obtain the proper piston clearance.

Cylinder walls that are severely marred and/or worn beyond the specified limits should be refinished. Before any cylinder is refinished, all main bearing caps must be in place and tightened to the proper torque so that the crankshaft bearing bores will not become distorted from the honing operation.

Refinish only the cylinder or cylinders that require it. All pistons are the same weight, both standard and oversize; therefore, various sized pistons can be intermixed without upsetting engine balance.

Refinish the cylinder with the most wear first to determine the maximum oversize. If the cylinder will not clean up when refinished for the maximum oversize piston recommended, replace the block.

Refinish the cylinder to within an approximately 0.0015 inch of the required oversize diameter. This will allow enough stock for the final step of honing so that the correct surface finish and pattern are obtained. Use clear sharp hones of No. 220-280 grit for this operation.

For the proper use of the refinishing equipment, follow the instructions of the manufacturer. Only experienced personnel should be allowed to perform this work.

After the final operation in either of the two refinishing methods described and prior to checking the piston fit, thoroughly wash the cylinder walls with solvent to remove all abrasive particles, then thoroughly dry the walls. Check the piston fit. Mark the pistons to correspond to the cylinders in which they are to be installed. When the refinishing of all cylinders that require it has been completed and all pistons fitted, thoroughly clean the entire block to remove all particles from the bearing bores, oil passages, cylinder head bolt holes, etc. Coat the cylinder walls with oil.

**OIL PAN AND OIL PUMP (AND 430 ENGINE VACUUM BOOSTER)**

**OIL PAN**

Scrape any dirt or metal particles from the inside of the pan. Scrape all old gasket material from the gasket surface. Wash the pan in a solvent and dry it thoroughly. Be sure all foreign matter is removed from below the baffle plate.

Check the pan for cracks, holes, damaged drain plug threads, a loose baffle, and a nicked or warped gasket surface.

Repair any damage, or replace the pan if repairs cannot be made.

**OIL PUMP**

Cleaning. Wash all parts in a solvent and dry them thoroughly. Use a brush to clean the inside of the pump housing and the pressure relief valve chamber. Be sure all dirt and chips are removed.

Clean the vacuum pump housing, rotor, and vanes (430 engine).

Inspection. Check the inside of the pump housing and the outer race and rotor for damage or excessive wear.

Check the mating surface of the pump cover for wear. If the cover mating surface is worn, scored, or grooved, replace the cover.

Measure the outer race to housing clearance (Fig. 26).

With the rotor assembly installed in the housing, place a straight edge over the rotor assembly and the housing. Measure the rotor end play clearance between the straight edge and the rotor and outer race (Fig. 27).

The outer race, shaft and rotor are replaceable only as an assembly.

Check the drive shaft to housing bearing clearance by measuring the...
O.D. of the shaft and the I.D. of the housing bearing.

Inspect the relief valve spring for a collapsed or worn condition.

Check the relief valve spring tension. If the spring tension is not within specifications and/or the spring is defective, replace the spring.

Check the relief valve piston for scores and free operation in the bore.

On a 430 engine pump, inspect all the vacuum pump parts for damage. Replace the complete vacuum pump if any part is damaged.

CRANKCASE VENTILATION SYSTEM MAINTENANCE

Refer to Group 17 for the correct mileage interval for maintenance.

The breather cap located on the oil filler tube should be cleaned with a solvent at the proper mileage interval. After cleaning, oil the mesh screen in the cap with light engine oil.

The road draft tube seldom requires cleaning except during a high mileage engine overhaul. However, if there is evidence of crankcase pressure, the tube should be checked for excessive sludge and cleaned out if necessary. In addition, on the 352 engines, the maze screen in the intake manifold baffle plate should be cleaned in solvent to remove any accumulation of sludge deposits.
1 DESCRIPTION

FIG. 1—Thunderbird 352 Special V-8 Engine

The Thunderbird 352 Special V-8 engine (Figs. 1 and 2) has a 4.00-inch bore and a 3.50-inch stroke and a total piston displacement of 352 cubic inches. It has a compression ratio of 9.6:1. The patent plate symbol for the engine is "H."

MANIFOLDS

The intake manifold, which also serves as the valve push rod chamber cover, contains a passage through the center section and under the carburetor, through which hot exhaust gases are directed to assist in vaporizing the incoming fuel charge (Fig. 3).

The exhaust gases are directed into the intake manifold by a thermosonically controlled exhaust valve (Fig. 4). The valve is located at the outlet of the right exhaust manifold. When the valve is in the closed (heat on) position, part of the exhaust gases are directed from the right exhaust manifold, through the heat riser passage, to the left exhaust manifold. When the valve opens (heat off), more of the exhaust gases from the right manifold are permitted to flow directly out the exhaust system in the normal manner.

The intake manifold has two sets of fuel passages, each with its own
FIG. 3—Intake Manifold Exhaust Gas Passages

separate inlet connection to the carburetor (Fig. 5). The right barrels of the carburetor feed Nos. 1, 4, 6, and 7 cylinders and the left barrels feed Nos. 2, 3, 5, and 8 cylinders.

The distributor is mounted at the left front of the intake manifold.

CYLINDER HEADS

The cylinder head assemblies contain the valves and the valve rocker arm shaft assembly. The combustion chambers are cast in the head. Valve guides are an integral part of the head. The valves are arranged from front to rear on both banks E-1-E-1-E-1-E (Fig. 6).

CYLINDER BLOCK

The cylinders are numbered from front to rear on the right bank 1, 2, 3, 4 and on the left bank 5, 6, 7, 8. The firing order is 1-5-4-2-6-3-7-8.

The crankshaft is supported by five main bearings. Crankshaft end thrust is controlled by the flanges of the No. 3 main bearing.

The top compression ring of the piston is chrome-plated and the lower

FIG. 4—Exhaust Gas Control Valve

FIG. 5—Intake Manifold Fuel Passages

compression ring is phosphate-coated. The oil control ring assembly consists of a serrated spring and two chrome-plated steel rails.

VALVE TRAIN

The intake and exhaust valve assemblies are the rotating-type.

The valve rocker arms do not have adjusting screws because there is no valve lash adjustment with hydraulic valve lifters.

The camshaft is supported by five bearings pressed into the block.

The camshaft is driven by a sprocket and timing chain in mesh with a sprocket on the crankshaft. Camshaft end play is controlled by a thrust button and spring located between the camshaft sprocket bolt and the cylinder front cover.

Hydraulic valve lifters are used which provide zero valve lash and minimize valve train noise. The operation and parts identification of the hydraulic valve lifters are shown in Fig. 7.

When the valve is closed, the lifter assembly is on the base circle of the camshaft lobe and the valve push rod is in its lowest position. With the lifter assembly in this position, the plunger spring expands forcing the plunger upward. This action is transmitted to the valve rocker arm via the valve push rod until there is solid contact between the valve and the valve end of the valve rocker arm (zero valve lash). In this position, the oil hole in the lifter and plunger is indexed with the lifter oil gallery and oil is forced under pressure into the plunger. This creates a pressure differential above and below the valve disc. The high pressure above the valve disc forces the valve disc open and the oil fills the area below the plunger, equalizing the pressure on each side of the valve disc.

FIG. 6—Valve Port Arrangement

FIG. 7—Typical Hydraulic Valve Lifter Operation
LUBRICATION SYSTEM

Oil from the oil pan sump is forced through the pressure-type lubrication system (Fig. 8) by a rotor oil pump. The oil pump is mounted in the front of the crankcase. A spring loaded relief valve in the pump limits the maximum pressure of the system. Oil relieved by the valve is directed back to the intake side of the pump.

A full-flow filter filters the entire output of the pump before it enters the engine. A relief valve in the filter permits oil to bypass the filter if it becomes clogged.

The oil from the filter flows into the main oil gallery which supplies oil to each camshaft bearing, through drilled passages in the block. Passages are drilled from each camshaft bearing to each main bearing. Number 1 camshaft bearing feeds No. 1 main bearing, and No. 2 camshaft bearing feeds No. 2 main bearing, etc.

The oil then flows through notches or grooves in the main bearings to lubricate the crankshaft journals. A joggle pin in the main oil gallery front plug allows any air that may be trapped in the oil to escape. The timing chain and sprockets are splash lubricated by oil from the joggle pin.

The crankshaft is drilled from the main bearings to the connecting rod bearings. The oil flow is a follows:
CRANKCASE VENTILATION

A crankcase ventilation tube is located at the rear of the engine. The forward motion of the car causes a partial vacuum to be formed at the tube outlet. This vacuum action causes air to be drawn through the engine from the oil filler cap located at the front of the intake manifold (Fig. 10). The filler cap contains a filtering element which filters the incoming air.

From the filler cap, the air flows into the front section of the valve push rod chamber where there are few contaminating vapors. Here, the incoming air has a chance to warm up before contacting contaminating vapors originating in the crankcase. Warm ventilating air minimizes the formation of crankcase sludge.

The ventilating air is directed by a baffle, located on the underside of the intake manifold, upward into the front of both valve rocker arm chambers. The baffle also directs air to the front of the lower crankcase and into the timing chain chamber.

Air from the valve rocker arm chamber and from the crankcase flows into the rear of the valve push rod chamber. All air is then directed out the crankcase ventilation tube.

COOLING SYSTEM

The coolant is drawn from the bottom of the radiator by the water pump which delivers the coolant to the cylinder block (Fig. 11).

The coolant travels through cored passages to cool the entire length of each cylinder wall. Upon reaching the rear of the cylinder block, the coolant is directed upward into the cylinder heads where it cools the combustion chambers, valves, and valve seats on its return to the front of the engine.

The coolant from each cylinder head flows through the water passages in the intake manifold and past the water thermostat, if it is open, into the radiator supply tank. If the thermostat is closed, a small portion of the coolant is closed, a small portion of the coolant is returned to the water pump for recirculation. The entire system is pressurized to 13-15 psi.
ENGINE REMOVAL AND INSTALLATION

The procedures given are for the engine without the transmission attached. If the engine and transmission are removed as an assembly, install standard eye bolts with \( \frac{3}{4} \)-14 threads in the bosses at the top rear of the exhaust manifolds. Then attach the engine lifting bracket and sling to the eye bolts. The engine installation is shown in Fig. 12.

REMOVAL

1. Drain the cooling system and the crankcase.
2. Disconnect the battery ground cable at the engine.
3. Remove the hood, radiator, and the air cleaner.
4. Remove the oil level dipstick and the coil.
5. Disconnect the oil pressure sending unit wire at the sending unit and the flexible fuel line at the fuel tank line.
6. Disconnect the flexible windshield wiper line at the vacuum pump and position it out of the way.
7. Remove the wire loom from the clips on the left valve rocker arm cover and position the wires out of the way.
8. On a car with a windshield washer, disconnect the three lines at the washer pump and position them out of the way.
9. On a car with a manual-shift transmission, disconnect the accelerator. Remove the accelerator retreating spring.
10. On a car with an automatic transmission, disconnect the accelerator rod and the transmission rod at the accelerator cross shaft bracket and secure them to the dash panel.
11. On a car with power steering, disconnect the power steering pump bracket from the water pump, then wire the power steering pump to the hood left hinge in a position that will prevent the oil from draining out.
12. On a car with power brakes, disconnect the power brake line at the intake manifold and at the flexible line, then release the line from the brackets on the left valve rocker arm cover and remove the line.
13. On a car with an air conditioner, disconnect the magnetic clutch wire. Isolate the compressor.
14. Disconnect the heater hose at the water pump and at the intake manifold.
15. Disconnect the generator wires at the generator.
16. Disconnect the engine temperature sending unit wire at the sending unit.
17. Remove the engine ground strap and the starter cable retaining bracket from the rear of the right cylinder head.
18. Raise the front of the car.
19. Remove the starter and dust seal (and the automatic transmission fluid filler tube bracket). Remove the crankcase ventilation tube.
20. Disconnect the muffler inlet pipes from the exhaust manifolds, and the engine right and left support insulators at the engine.
21. On a car with an automatic transmission, remove the converter housing lower access cover and the cover assembly. Remove the flywheel to converter nuts. Secure the converter assembly in the housing. Remove the converter housing to engine lower bolts, and remove the oil cooler lines retaining clamp from the engine block.
22. On a car with a manual-shift transmission, remove the flywheel housing inspection cover and the clutch pedal retracting spring. Disconnect the clutch release bracket at the equalizer rod and remove the bracket from the engine. Remove the flywheel housing to engine upper bolts.
23. Lower the car, then support the transmission. Remove the converter or flywheel housing upper retaining bolts.
24. Install the engine left lifting bracket on the front of the left cylinder head where the coil mounts. Install the engine right lifting bracket at the rear of the right cylinder head. Attach the engine lifting sling (Fig. 13.)
25. Raise the engine slightly and carefully pull it from the transmission.
26. Lift the engine out of the engine compartment and install it on a work stand (Fig. 14).
INSTALLATION

1. Position the exhaust gas control valve, with a new gasket on each side, on the right exhaust manifold studs. Temporarily tie the valve to the manifold. Place a new gasket over the studs of the left exhaust manifold.
2. Loosen the engine right and left support insulators at the underbody.
3. Attach the engine lifting brackets and sling (Fig. 13), then remove the engine from the work stand.
4. Lower the engine carefully into the engine compartment. Make sure the exhaust manifolds are properly aligned with the muffler inlet pipes and the dowels in the block engage the holes in the flywheel housing or converter housing.
5. On a car with an automatic transmission, start the converter pilot into the crankshaft.
6. On a car with a manual-shift transmission, start the transmission main drive gear into the clutch disk. It may be necessary to adjust the position of the transmission in relation to the engine if the input shaft will not enter the clutch disk. If the engine "hangs up" after the shift enters, turn the crankshaft slowly (transmission in gear) until the shaft splines mesh with the clutch disc splines.
7. Install the crankcase ventilation tube and the flywheel housing or converter housing upper bolts. Tighten the bolts to specifications.
8. Start the engine right and left support insulator to engine bolts. Disconnect the engine lifting sling and remove the lifting brackets.
9. Raise the front of the car. Install the flywheel housing or converter housing lower retaining bolts. Tighten the bolts to specifications.
10. On a car with an automatic transmission, remove the retainer securing the converter in the housing, then install the flywheel to converter lockwashers and nuts. Tighten the nuts to specifications. Install the converter lower access plate and the housing cover assembly. Install the oil cooler lines retaining clamp.
11. On a manual-shift transmission, install the clutch bracket. Connect the clutch release rod and install the clutch retracting spring. Install the flywheel housing lower cover.
12. Tighten all the engine front support insulator bolts and nuts to 45-50 foot-pounds torque.
13. Remove the retainer securing the exhaust gas control valve, then connect both exhaust manifolds to the muffler inlet pipes. Tighten the nuts to specifications.
14. Position the dust seal and install the starter (and the automatic transmission fluid filler tube bracket).
15. Remove the support from the transmission and lower the car.

16. Connect the generator wires.
17. Connect the engine temperature sending unit wire. Connect the heater hose at the intake manifold.
18. Connect the engine ground strap and install the starter cable retaining clamp to the rear of the right cylinder head.
19. Connect the flexible fuel line, the oil pressure sending unit wire, and the windshield wiper vacuum line.
20. Install the coil and connect the coil primary and high tension wires.
21. Install the oil level dipstick.
22. Position the wire loom in the retaining clips on the left valve rocker arm cover.
23. On a car with a windshield washer, connect the three washer pump lines.
24. On a car with an automatic transmission, connect the accelerator rod and the transmission rod.
25. On a car with a manual-shift transmission, install the accelerator retracting spring. Connect the accelerator rod.
26. On a car with power steering, connect the power steering pump bracket to the water pump.
27. On a car with power brakes, connect the power brake line to the intake manifold and to the flexible line and install the line in the retaining clips on the left valve rocker arm cover.
28. On a car with an air conditioner, connect the magnetic clutch wire and the compressor lines.
29. Install the radiator.
30. Fill and bleed the cooling system. Connect the heater hose at the water pump.
31. Fill the crankcase with the proper grade and quantity of engine oil.
32. Operate the engine at fast idle and check all gaskets and hose connections for leaks.
33. On a car with an automatic transmission, adjust the transmission control linkage.
34. Install the air cleaner.

ENGINE DISASSEMBLY—ENGINE REMOVED

INTAKE MANIFOLD AND DISTRIBUTOR

3. Disconnect the distributor vacuum line at the distributor.
4. Remove the carburetor fuel inlet line, the vacuum pump lines, then remove the fuel pump and discard the gasket.
5. Remove the radiator supply tank.
6. Slide the clamp on the water pump bypass hose toward the water pump.
7. Remove the automatic choke heat tube.
8. Remove the valve rocker arm covers.
9. Crank the engine until the No. 1 piston is at T.D.C., at the end of the compression stroke.
10. Rotate the crankshaft damper an additional 45°.
11. Starting at the No. 4 cylinder, loosen the right valve rocker arm shaft support bolts in sequence, two turns at a time. After the bolts are all loosened, remove the valve rocker arm shaft assembly and the oil baffle plate.

fully remove it from the engine.
18. Remove the intake manifold gaskets and seals.
19. Remove the baffle plate from the valve push rod chamber floor by prying up on the baffle with a screwdriver (Fig. 16).
20. Lift the hydraulic valve lifters from the cylinder block and place them in a rack so that they can be installed in their original bore. The internal parts of each hydraulic valve lifter assembly are matched sets. Do not intermix the parts. Keep the assemblies intact until they are to be cleaned.
21. If the hydraulic valve lifters can not be removed with the fingers, remove them with the tool shown in Fig. 17.

FIG. 15—Intake Manifold Removal or Installation

3. Remove the oil pump attaching bolts and remove the oil pump and inlet tube as an assembly. Remove the oil pump drive shaft. Discard the oil pump gasket.

FLYWHEEL
1. On a flywheel for a manual-shift transmission, mark the pressure plate cover so that it can be replaced in the same position, and remove the clutch pressure plate and cover assembly.

FIG. 16—Baffle Plate Removal

CYLINDER FRONT COVER
1. Disconnect the drive belt adjusting arm at the generator.
2. Remove the generator support bolt at the water pump and the bracket bolt at the cylinder block.
3. Remove the generator, brackets, and drive belts.
4. Remove the water pump, pulley, and fan as an assembly.
5. On a car with power steering, remove the power steering pulley.
6. Remove the crankshaft damper cap screw and washer from the end of the crankshaft.
7. Install the puller on the crankshaft damper (Fig. 19) and remove the damper.

FIG. 17—Hydraulic Valve Lifter Removal

CYLINDER HEADS
1. Remove the exhaust manifold lower retaining bolts and tab washers and remove the exhaust manifolds. Remove the spark plugs.
2. Remove the cylinder head bolts, and then install the cylinder head holding fixtures (Fig. 18).
3. Lift the cylinder head off the block. Do not pry between the head and the block. Remove and discard the cylinder head gasket.

FIG. 18—Cylinder Head Holding Fixtures

2. Remove the flywheel retaining bolts and remove the flywheel.

FIG. 19—Crankshaft Damper Removal

OIL FILTER AND ADAPTER
Unscrew the oil filter from the adapter. Remove the oil filter adapter assembly and oil pressure sending unit as an assembly. Discard the gasket.

OIL PAN AND OIL PUMP
1. Invert the engine on the work stand.
2. Remove the oil pan retaining screws and remove the oil pan. Discard the gasket.
FIG. 20—Crankshaft Sleeve
Removal
8. If the crankshaft sleeve is not stepped down (the same O.D. on both ends), remove it as shown in Fig. 20. If the crankshaft sleeve is stepped down (different O.D. on each end), remove it with a three-jawed puller (tool 7675-N).
9. Remove the cylinder front cover. Discard the cylinder front cover gasket.

TIMING CHAIN AND SPROCKET

1. Remove the crankshaft front oil slinger.
2. Remove the camshaft thrust button and spring, the sprocket cap screw, the thrust button spring retainer, and the fuel pump eccentric.
3. Slide both sprockets and the timing chain forward, and remove the sprockets and timing chain as an assembly (Fig. 21).

CONNECTING ROD ASSEMBLIES

1. Turn the engine on the work stand so that the front end is up.
2. Remove any ridge and/or carbon deposits from the upper end of the cylinder bores. Move the piston to the bottom of its travel and place a cloth on the piston head to collect the cuttings. Remove the cylinder ridge with a ridge cutter. Follow the instructions furnished by the tool manufacturer. Never cut into the ring travel area in excess of 1/32 inch when removing ridges.
3. Make sure all connecting rods and caps are marked so that they can be installed in their original locations.
4. Turn the crankshaft until the connecting rod being removed is down.
5. Remove the connecting rod cap.
6. Push the connecting rod and piston assembly out the top of the cylinder with the handle end of a hammer. Avoid damage to the crankpin or the cylinder wall when removing the piston and rod.

FIG. 21—Timing Chain Removal or Installation
7. Remove the bearing inserts from the connecting rods and caps.

CRANKSHAFT

1. Remove the main bearing caps.
2. Carefully lift the crankshaft out of the cylinder block so that the thrust bearing surfaces are not dam-
aged. Handle the crankshaft with care to avoid possible fracture or damage to the finished surfaces.
3. Remove the rear journal oil seal from the block and rear bearing cap, and remove the cap to block side seals.
4. Remove the main bearing inserts from the block and bearing caps.

CAMSHAFT

Carefully remove the camshaft by pulling it toward the front of the engine. Use caution to avoid damaging the journals and lobes.

CAMSHAFT BEARINGS

Drill a 1/2-inch hole in the camshaft rear bearing bore plug and use tool T-7600-E to remove the plug. Remove the camshaft bearings (Fig. 22).

FIG. 22—Camshaft Bearing Removal or Installation

ASSEMBLY

1. Lubricate all parts with engine oil. Apply Lubriplate to the pad of the valve rocker arms.
2. If the plugs were removed from the ends of the shaft, use a blunt tool or large diameter pin punch and install a plug, cup side out, in each end of the rocker arm shaft.
3. Install the rocker arms, supports, and springs in the order shown in Fig. 23. Be sure the oil holes in the shaft are facing downward. Complete the assembly by installing the remaining two flat washers with the spring washer between them and install the cotter pin.

**CYLINDER HEADS**

**DISASSEMBLY**

1. Clean the carbon out of the cylinder head combustion chambers before removing the valves.

2. Compress the valve springs (Fig. 24). Remove the spring retainer locks, and release the spring.

3. Remove the sleeve, spring retainer, spring, stem seal, and valve. Discard the valve stem seals. Identify all valve parts.

**ASSEMBLY**

1. Install each valve (Fig. 25) in the guide from which it was removed or to which it was fitted. Install a new stem seal on the valve.

2. Install the valve spring over the valve, and then install the spring retainer and sleeve.

3. Compress the spring and install the retainer locks (Fig. 24).

4. Measure the assembled height of the valve spring from the surface of the cylinder head spring pad to the underside of the spring retainer with dividers (Fig. 26). Check the dividers against a scale. If the assembled height is greater than 1 13/64 inches, install the necessary 0.030-inch thick spacer(s) between the cylinder head spring pad and the valve spring to bring the assembled height to the recommended height of 1 1/8 - 1 13/64 inches. Do not install spacers unless necessary. Use of spacers in excess of recommendations will result in overstressing the valve springs which will lead to excessive load and spring breakage.

**HYDRAULIC VALVE LIFTERS**

Each valve lifter is a matched assembly. If the parts of one lifter are
FIG. 27—Typical Hydraulic Valve Lifter Assembly

inter-mixed with those of another, improper valve operation may result. Disassemble and assemble each lifter separately. Keep the lifter assemblies in proper sequence so that they can be installed in their original bore.

**DISASSEMBLY**

1. Grasp the lock ring with needle nose pliers to release it from the groove. If necessary, depress the plunger to fully release the lock ring.
2. Remove the push rod cup, plunger, and spring.
3. Invert the plunger assembly and remove the disc valve retainer by carefully prying up on it with a screwdriver. Then remove the disc valve and spring.

FIG. 28—Piston Pin Removal

**ASSEMBLY**

A typical hydraulic valve lifter is shown in Fig. 27.
1. Place the plunger upside down on a clean work bench.
2. Place the disc valve in position over the oil hole on the bottom of the plunger. Set the disc valve spring on top of the disc.
3. Position the disc valve retainer

FIG. 29—Piston, Connecting Rod, and Related Parts

over the disc and spring and push the retainer down into place on the plunger.
4. Place the plunger spring, and then the plunger (open end up) into the lifter body.
5. Place the push rod seat in the plunger.
6. Depress the plunger. Position the closed end of the lock ring in the groove of the lifter body. With the plunger still depressed, position the open ends of the lock ring in the groove. Release the plunger, then depress it again to fully seat the lock ring.

PISTONS AND CONNECTING RODS

**DISASSEMBLY**

1. Mark the pistons and pins to assure assembly with the same rod and installation in the same cylinder from which they were removed.
2. Remove the piston rings. Remove the piston pin retainers, then drive the pin out of the piston and connecting rod (Fig. 28). Discard the retainers.

**ASSEMBLY**

The piston, connecting rod, and related parts are shown in Fig. 29.
1. Lubricate all parts with light engine oil.
2. Position the connecting rod in the piston and push the pin into place. Assemble the piston and connecting rod so that the bearing lock slots will be to the outside of the engine "V" (Fig. 30).
3. Insert new piston pin retainers by spiraling them into the piston with the fingers. Do not use pliers.
4. Follow the instructions contained on the piston ring package and install the piston rings.
5. Check the ring side clearance of the compression rings with a feeler gauge inserted between the ring and its lower land (step 6 under “Fitting Piston Rings” in Part 1-1).
6. Be sure the bearing inserts and the bearing bore in the connecting rod and cap are clean. Foreign material under the inserts may distort the bearing and cause a failure. Install the bearing inserts in the connecting rod and cap with the tangs fitting in the slots provided.

**OIL PUMP**

**DISASSEMBLY**

1. Remove the oil inlet tube from the oil pump and remove the gasket.

**FIG. 30—Connecting Rod and Piston Assembly**

**FIG. 31—Oil Pump Assembly**
2. Remove the cover retaining screws, then remove the cover. Remove the inner rotor and shaft assembly, then remove the outer race.
3. Insert a self-threading sheet metal screw of the proper diameter into the oil pressure relief valve chamber cap and pull the cap out of the chamber. Remove the spring and plunger.

ASSEMBLY

The oil pump assembly is shown in Fig. 31.
1. Oil all parts thoroughly.
2. Install the oil pressure relief valve plunger, spring, and a new cap.
3. Install the outer race, and the inner rotor and shaft assembly. The inner rotor and shaft, and the outer race are serviced as an assembly. One part should not be replaced without replacing the other. Install the cover and tighten the cover retaining screws to 6-9 foot-pounds torque.
4. Position a new gasket and the oil inlet tube on the oil pump and install the retaining bolts.

ENGINE ASSEMBLY—ENGINE REMOVED

FIG. 32—Camshaft Front Bearing Measurement

CAMSHAFT BEARINGS

Camshaft bearings are available pre-finished to size for standard and 0.015-inch undersize journals. The bearings are not interchangeable from one bore to another. The bearings must be installed in their respective bores.
1. Position the new bearing at the bearing bore, and press it into place with the tool shown in Fig. 22. Align the oil holes in the bearing with the oil holes in the cylinder block when the bearings are installed. Be sure the camshaft front bearing is installed 0.005-0.020 inch below the front face of the cylinder block (Fig. 32).
2. Clean out the camshaft rear bearing bore plug recess thoroughly.
3. Coat the flange of a new plug with water resistant sealer and install it with the flange facing in (Fig. 33).
4. Drive the plug in until it is flush or slightly below the casting surface.

CAMSHAFT

The camshaft and related parts are shown in Fig. 34.

Oil the camshaft and apply Lubriplate to all lobes, then carefully slide it through the bearings.

CRANKSHAFT

The crankshaft and related parts are shown in Fig. 35.
1. Be sure that the rear journal oil seal grooves are clean. Install a new rear journal oil seal in the block (Fig. 36) and rear main bearing cap (Fig. 37). After installation, cut the ends of the seals flush.
2. If the crankshaft main bearing journals have been refinished to a definite undersize, install the correct undersize bearings. Be sure the bearing inserts and bearing bores are clean. Foreign material under the inserts may distort the bearing and cause a failure.
Place the upper main bearing inserts in position in the bore with the tang fitting in the slot provided.

FIG. 33—Camshaft Rear Bearing Bore Plug Installation

3. Install the lower main bearing inserts in the bearing caps.
4. Carefully lower the crankshaft into place. Be careful not to damage the surfaces.
5. Check the clearance of each main bearing, following the proced-
FIG. 35—Crankshaft and Related Parts

6. If the bearing clearances are satisfactory, apply a light coat of engine oil to the journals and bearings, then install all the bearing caps, except the thrust bearing cap (No. 3 bearing). Main bearing caps are numbered 1 thru 5 starting at the front of the engine. The arrows on the cap should be pointed toward the front of the engine. Tighten the bearing cap bolts to specifications.

7. Install the thrust bearing cap with the bolts finger tight.

8. Pry the crankshaft forward against the thrust surface of the upper half of the bearing (Fig. 38).

9. Hold the crankshaft forward and pry the thrust bearing cap to the rear (Fig. 38). This will align the thrust surfaces of both halves of the bearing.

10. Retain the forward pressure on the crankshaft, and tighten the cap bolts to specifications (Fig. 38).

11. Force the crankshaft toward the rear of the engine.

12. Install a dial indicator, so that the contact point rests against the crankshaft flange and the indicator axis is parallel to the crankshaft axis (Fig. 39).

13. Set the dial at zero. Push the crankshaft forward and note the reading on the dial.

14. If the end play exceeds the wear limit, replace the thrust bearing. If the end play is less than the minimum limit, inspect the thrust bearing faces for scratches, burrs, nicks, or dirt. If the thrust faces are not defective or dirty, they probably were not aligned properly. Install the thrust bearing and align the faces, following the recommended procedure (steps 7, 8, 9, and 10). Recheck the end play.

15. Dip the rear bearing cap side seals in light engine oil. Immediately install them in the grooves. Do not use sealer on the side seals, the seals are designed to expand when dipped in oil. Using sealer may retard this expansion. It may be necessary to tap the seals into place for the last 1/2 inch of travel. Do not cut the seal projecting ends.
FIG. 38—Thrust Bearing Alignment

16. Check the rear main bearing cap side seals for leaks by squirting a few drops of oil into the parting lines between the bearing cap and the cylinder block from the outside. Blow compressed air against the seals from the inside of the block. If air bubbles appear in the oil, it indicates possible oil leakage. This test should not be performed on newly installed seals until sufficient time has been allowed for the seals to expand into the seal grooves.

CONNECTING ROD ASSEMBLIES

1. Turn the engine on the work stand so that the front end is up.
2. Oil the piston rings, pistons, and cylinder walls with light engine oil.
3. Be sure to install the pistons in the same cylinders from which they were removed, or to which they were fitted. Each connecting rod and bearing cap are numbered from 1 to 4 in the right bank and from 5 to 8 in the left bank, beginning at the front of the engine. The numbers on the connecting rod and bearing cap must be on the same side when installed in the cylinder bore. If a connecting rod is ever transposed from one block or cylinder to another, new bearings should be fitted and the connecting rod should be numbered to correspond with the new cylinder number.
4. Make sure the ring gaps are properly spaced around the circumference of the piston.
5. Install a piston ring compressor on the piston and push the piston in with a hammer handle until it is slightly below the top of the cylinder (Fig. 40). Be sure to guide the connecting rods to avoid damaging the crankshaft journals. Install the piston with the indentation in the piston head toward the front of the engine. When installed, the bearing lock slots in the connecting rod should be toward the outside of the engine.
6. Check the clearance of each bearing, following the procedure under "Connecting Rod Bearing Replacement" in Part 1-1.
7. If the bearing clearances are to specifications, apply a light coat of engine oil to the journals and bearings.
8. Turn the crankshaft throw to the bottom of its stroke, then push the piston all the way down until the connecting rod bearing seats on the crankshaft journal.
9. Install the connecting rod cap, then tighten the nuts to specifications.
10. After the piston and connecting rod assemblies have been installed, check the side clearance between the connecting rods on each crankshaft journal (Fig. 41).
FIG. 42—Aligning Timing Marks

TIMING CHAIN AND SPROCKETS

1. Lubricate the timing chain and sprockets with engine oil. Place the key in position in the slot on the crankshaft.
2. Position the sprockets and timing chain on the camshaft and crankshaft (Fig. 21). Be sure the timing marks on the sprockets are positioned as shown in Fig. 42.
3. Rotate the crankshaft in a clockwise direction (as viewed from the front) to take up the slack on the left side of the chain.
4. Establish a reference point on the block and measure from this point to the chain (Fig. 43).
5. Rotate the crankshaft in the opposite direction to take up the slack on the right side of the chain. Force the left side of the chain out with the fingers and measure the distance between the reference point and the chain. The deflection is the difference between the two measurements.
6. If the deflection exceeds ½ inch, replace the timing chain and/or sprockets.
7. Install the fuel pump eccentric (Fig. 44), and the camshaft sprocket cap screw and thrust button spring retainer. Tighten the sprocket cap screw to specifications. Install the camshaft thrust button spring and thrust button. Install the crankshaft front oil slinger.

FIG. 44—Fuel Pump Eccentric and Front Oil Slinger Installed

CYLINDER FRONT COVER INSTALLATION

FRONT OIL SEAL REPLACEMENT

It is good practice to replace the oil seal each time the cylinder front cover is removed.
1. Drive out the old seal with a pin punch, then clean out the recess in the cover.
2. Coat a new seal with grease. Install the seal (Fig. 45).
3. Drive the seal in until it is fully seated in the recess.
4. After installation, check the seal to be sure the spring is properly positioned in the seal.
5. Lubricate the crankshaft with a white lead and oil mixture and lubricate the oil seal rubbing surface with grease.

FIG. 45—Oil Seal Installation

FIG. 46—Cylinder Front Cover Alignment
6. Install the crankshaft sleeve (Fig. 47) with the smallest O.D. end into the cylinder front cover bore if the sleeve is stepped down (different O.D. on each end).

7. Line up the damper keyway with the key on the crankshaft. Install the damper on the crankshaft (Fig. 48).

8. Install the damper cap screw and washer, and tighten the screw to specifications.

On an engine with a separate power steering pulley, install the pulley on the crankshaft damper. Tighten the screws to specifications.

9. Clean the water pump gasket surfaces and apply seal. Position new gaskets on the pump and install the water pump, pulley, and fan as an assembly.

On an engine with a power steering pump, the pump is retained by the water pump retaining bolts.

10. Using a new gasket, install the fuel pump. Install the generator, brackets, and drive belts.

**OIL PUMP AND OIL PAN**

1. Invert the engine on the work stand. Position the oil pump drive shaft into the oil pump socket. With the shaft firmly seated in the distributor socket, position the oil pump into place. The stop on the shaft should touch the roof of the crankcase. Remove the shaft and oil pump and position the stop as necessary.

2. With the stop properly positioned, insert the oil pump drive shaft into the oil pump.

3. Position a new gasket on the pump housing and install the pump and shaft as an assembly (Fig. 49).

4. Position a new gasket on the oil pan and place the oil pan assembly on the block. Install the retaining screws and tighten them, from the center outward, to specifications.

**FLYWHEEL**

1. Position the flywheel on the crankshaft and install the retaining bolts. Tighten the bolts to specifications.

2. On a flywheel for a manual-shift transmission, use tool 7563 to locate the clutch disc. Install the pressure plate. Tighten the retaining bolts to specifications.

**OIL FILTER AND ADAPTER**

The oil filter assembly is shown in Fig. 50.

1. Clean the oil filter adapter gasket surfaces.

2. Apply sealer to a new adapter gasket, and install the adapter assembly and gasket.

3. Clean the adapter filter recess. Coat the gasket on a new filter with oil. Place the filter in position on the adapter. Hand tighten the filter until the gasket contacts the adapter face, and then advance it 1½-turn.

**CYLINDER HEADS**

1. Clean the cylinder head and block gasket surfaces.

2. Inspect the head for any damage and repair as necessary.

3. Apply cylinder head gasket sealer to both sides of a new gasket.

4. Guided by the word "Front" on the gasket, install the gasket over the cylinder head dowels.

5. Place the cylinder head on the engine, then remove the holding fixtures.

6. Install the cylinder head bolts.

7. The cylinder head bolts are tightened in three progressive steps. Follow the sequence shown in Fig. 51. Tighten the bolts to 60-70 foot-pounds torque, then tighten them to 70-80 foot-pounds torque. Finally, tighten the bolts to 80-90 foot-pounds torque in the same sequence. After the cylinder head bolts have been tightened to specifications, the bolts should not be disturbed.

8. Coat the mating surfaces of the exhaust manifold with a light film of graphite grease.

9. On the right exhaust manifold, using a new gasket, install the automatic choke air chamber cover on
the manifold. Be sure the cover is securely fastened. Position the exhaust gas control valve over the muffler inlet pipe studs of the manifold, using a new gasket on each side of the valve. Temporarily tie the valve to the exhaust manifold.

10. Position a new gasket over the muffler inlet pipe studs of the left exhaust manifold.

11. Position the exhaust manifold on the cylinder head and install the retaining bolts and tab washers. Tighten the retaining bolts to specifications, working from the center to the ends. Lock the bolts by bending one tab of the washer over a flat on the bolt.

12. Install the spark plugs.

13. Position the baffle plate in the valve push rod chamber. Press it into place with the hands (Fig. 52).

**VALVE LIFTERS**

Coat the outside of each valve lifter with engine oil to provide initial lubrication. Do not fill the lifters with oil. The lifters will fill much faster after the engine is started, if they are free of any oil film which may cause an oil seal between the plunger and the lifter body. Place each lifter in the bore from which it was removed.

**INTAKE MANIFOLD AND DISTRIBUTOR**

The intake manifold assembly is shown in Fig. 53.

1. Clean the mating surfaces of the intake manifold, cylinder heads, and cylinder block.

2. Coat the intake manifold and cylinder block seal surfaces with oil resistant sealer.

3. Position new seals on the cylinder block and new gaskets on the cylinder heads with the gasket resting on the cylinder head gasket tabs. Be sure the holes in the gaskets are aligned with the holes in the cylinder heads. The correct installation of the gaskets and seals are shown in Fig. 54.

4. Install the eye bolts in the intake manifold and attach the engine lifting sling and carefully lower the intake manifold on the engine (Fig. 15).

5. Position the intake manifold by inserting the distributor in place. After the intake manifold is in place, run a finger around the front and rear seal areas to make sure the seals are in place. If the seals are not in place, remove the intake manifold and reposition the seals.

6. Start the water pump by-pass hose on the intake manifold.

7. Be sure the holes in the manifold gaskets and manifold are in alignment. Install the manifold retaining bolts and tighten them to specifications, working from the center to the ends.

8. Remove the distributor and the engine lifting sling and eye bolts. Install the radiator supply tank.

9. Lubricate both ends of the valve push rods with engine oil. Install the valve push rods in their proper sequence, making sure the lower ends of the rods are positioned in the lifter push rod cup.

10. Crank the engine until the No. 1 piston is on T.D.C. at the end of the compression stroke.

11. Rotate the crankshaft damper an additional 45°.

12. Install the right valve rocker arm shaft assembly and the baffle plate on the cylinder head with the
6 REPAIR OPERATIONS—ENGINE INSTALLED

ENGINE SUPPORTS

The front supports are located on each side of the crankcase and the rear support is located at the transmission extension housing.

ENGINE FRONT SUPPORT

The engine front support is shown in Fig. 55. The procedures given apply to either a right or left installation.

Removal
1. Remove the insulator assembly to engine retaining bolts, and insulator to underbody retaining nut and washer.
   If only one support is being removed, loosen the other support.
2. Raise the engine about 1 inch with a jack and a block of wood placed under the oil pan, then remove the insulator assembly.

Installation
1. Position the insulator assembly. Install, but do not tighten, the insulator to engine lockwashers and bolts. If both supports have been removed, install the bolts on the opposite side before proceeding with step 2.
2. Lower the engine, then install the underbody to insulator lockwasher and nut and tighten the nut to specifications. Tighten the insulator to engine bolts to specifications.

ENGINE REAR SUPPORT

The engine rear support is shown in Fig. 56.

Removal
1. Remove the support retainer bolts and washers, and remove the support assembly to underbody bolts.
2. Raise the extension housing slightly to relieve the pressure on the support assembly. Remove the support assembly and retainer.

3. On a car with an automatic transmission, disconnect the accelerator rod at the carburetor. Remove the accelerator cross shaft bracket from the intake manifold and position it out of the way.
4. Remove the carburetor fuel inlet line, the windshield wiper vacuum line, and the vacuum booster pump line.
5. Disconnect the coil high tension lead, and the coil wires at the coil. Disconnect the oil pressure sending unit wire at the sending unit. Remove the wire loom from the retaining clips on the left valve rocker arm cover and position it out of the way.
6. Disconnect the spark plug wires at the spark plugs and remove the wires from the ignition harness brackets on the valve rocker arm covers.
7. Remove the distributor cap and spark plug wire assembly. Disconnect the distributor vacuum line at the distributor.
8. Disconnect the radiator upper

INTAKE MANIFOLD REMOVAL

1. Drain the cooling system. Remove the air cleaner.
2. On a car with a manual-shift transmission, disconnect the accelerator rod at the carburetor. Remove the accelerator retraction spring.

3. On a car with an automatic transmission, disconnect the accelerator rod at the carburetor. Remove the accelerator cross shaft bracket from the intake manifold and position it out of the way.

FIG. 55—Engine Front Support

FIG. 56—Engine Rear Support
hose at the radiator supply tank, then remove the supply tank. Remove the heater hose at the intake manifold, and the water temperature sending unit wire at the sending unit.

9. Remove the battery ground strap retaining screw from the thermostat housing. Slide the clamp on the water pump by-pass hose toward the water pump.

10. Remove the automatic choke heat tube. Disconnect the crankcase ventilation tube from the intake manifold.

11. Clean the outside of the valve rocker arm covers and remove the covers.

12. Complete the removal procedure by following steps 9 thru 17 under “Intake manifold and Distributor” on page 1-25.

INSTALLATION

1. Follow steps 1 thru 17 under “Intake Manifold and Distributor” on page 1-35.

2. Connect the battery ground strap, the water temperature sending unit, the heater hose, and the radiator upper hose.

3. Install the wire loom in the retaining clips on the left valve rocker arm cover.

4. Connect the oil pressure sending unit wire, the coil high tension leads, and the coil wires.

5. On a car with an automatic transmission, install the accelerator cross shaft bracket. Connect the accelerator rod.

6. On a car with a manual-shift transmission, install the accelerator retraction spring and connect the accelerator rod.

7. Fill and bleed the cooling system. Install the air cleaner.

8. On a car with an automatic transmission, adjust the transmission control linkage.

CYLINDER HEADS

REMOVAL

1. Remove the intake manifold and distributor, following the procedure in this section.

2. Remove the exhaust manifolds. If the left cylinder head is to be removed, remove the ignition coil.

3. Remove the cylinder head bolts. Install the cylinder head holding fixtures (Fig. 18).

4. Lift the cylinder heads off the block. Do not pry between the head and the block. Remove and discard the cylinder head gasket.

INSTALLATION

1. Clean the cylinder head and cylinder block gasket surfaces. Apply cylinder head gasket sealer to both sides of a new gasket. Guided by the word “FRONT” on the gasket, install the gasket over the cylinder head dowels.

2. Place the cylinder head on the engine, then remove the holding fixture. Install the cylinder head bolts.

3. The cylinder head bolts are tightened in three progressive steps. Follow the sequence shown in Fig. 51. Tighten the bolts to 60-70 foot-pounds torque, then tighten them to 70-80 foot-pounds torque. Finally, tighten the bolts to 80-90 foot-pounds torque.

4. Install the exhaust manifolds.

5. Install the intake manifold, valve rocker arm shaft assembly, and distributor, following steps 1 thru 17 under “Intake Manifold and Distributor” on page 1-35.

CRANKSHAFT DAMPER

REMOVAL

1. Drain the cooling system. Remove the hood, radiator supply tank, and the radiator.

2. Remove the drive belts.

3. On a car with power steering, remove the power steering pump pulley from the crankshaft damper.

4. Remove the cap screw and washer from the end of the crankshaft. Install the puller on the crank-shaft damper (Fig. 19) and remove the damper.

INSTALLATION

1. Line up the damper keyway with the key on the crankshaft. Then install the damper on the crankshaft (Fig. 48).

2. Install the damper cap screw and washer, and tighten the screw to specifications.

3. Install the drive belts, the radiator, radiator supply tank, and hood. Fill and bleed the cooling system.

CYLINDER FRONT COVER AND TIMING CHAIN

REMOVAL

1. Drain the cooling system and the crankcase. Remove the hood, air cleaner, radiator, and radiator supply tank.

2. Disconnect the carburetor fuel inlet line, manifold vacuum line, the windshield wiper vacuum line at the fuel pump. Disconnect the flexible fuel line.

3. Remove the fuel pump and gasket.

4. On a car equipped with power steering, disconnect the power steering pump bracket from the water pump, then wire the pump to the hood left hinge in a position that will prevent the oil from draining out.

5. Disconnect the heater hose at the water pump. Slide the water pump by-pass hose tube clamp toward the engine. Disconnect the drive belt adjusting arm at the water pump.

6. Loosen the generator mounting bolts at the generator. Remove the drive belt. Remove the generator support bolt at the water pump. Remove the water pump, drive belt adjusting arm, pulley, and fan as an assembly.

7. Remove the crankshaft damper and crankshaft sleeve. Remove the screws fastening the cylinder front cover to the block and oil pan, then remove the cylinder front cover.

On a car equipped with an air conditioner, the compressor brackets are retained by cylinder front cover screws.

8. Discard the cylinder front cover gasket. Remove the oil pan.

9. Remove the crankshaft front oil slinger. Crank the engine until the timing marks on the sprockets are positioned as shown in Fig. 42. Remove the camshaft thrust button and spring, the sprocket cap screw, the thrust button spring retainer, and the fuel pump eccentric.

10. Slide both sprockets and the timing chain forward, and remove the sprockets and timing chain as an assembly (Fig. 21).

INSTALLATION

1. Place the key in position in the slot on the crankshaft.

2. Position the sprockets and timing chain on the camshaft and crankshaft (Fig. 21). Be sure the timing marks on the sprockets are positioned as shown in Fig. 42.

3. Install the fuel pump eccentric, and the camshaft sprocket cap screw and thrust button spring retainer. Tighten the sprocket cap screw to specifications. Install the camshaft thrust button spring and thrust button. Install the crankshaft front oil slinger.

4. Clean the cylinder front cover, oil pan, and the block gasket surfaces.
FIG. 57—Valve Lifter Replacement

5. Working from the front of the engine, position the oil pan on the engine block. Install, but do not tighten, the oil pan to engine block retaining bolts.
6. Replace the crankshaft front oil seal.
7. Coat the gasket surface of the block and cover and the cover bolt threads with sealer. Position a new gasket on the block.
8. Install the alignment pilot tool on the cylinder front cover so that the keyway in the pilot aligns with the key in the crankshaft. Position the cover and pilot over the end of the crankshaft and against the block (Fig. 46).
9. Install the cylinder front cover bolts finger tight. Position the generator support bracket and the generator adjusting arm bracket, then install the bolts.

While pushing in on the pilot, tighten the cover bolts to specifications. Remove the pilot.
10. Install the oil pan to cylinder front cover bolts, then tighten all the oil pan bolts to specifications, working from the center of the pan outward.
11. Install the fuel pump, using a new gasket.
12. Install the crankshaft sleeve, then install the damper following the procedure in this section.
13. Install the water pump, drive belt adjusting arm, pulley and fan as an assembly.
14. Connect the carburetor fuel inlet line, the flexible fuel line, the manifold vacuum line, and the windshield wiper vacuum line.
15. Connect the heater hoses. Slide the water pump by-pass tube clamp forward on the tube.
16. Install the radiator, radiator supply tank, and the hood. Fill and bleed the cooling system. Connect the heater hose to the water pump.
17. Operate the engine at fast idle and check all hose connections and gaskets for leaks.

CAMSHAFT REMOVAL

1. Drain the cooling system and the crankcase. Remove the radiator, radiator supply tank, and the hood.
2. Remove the crankshaft damper, cylinder front cover, timing chain and sprockets, and the intake manifold, following the procedures in this section.
3. Lift the hydraulic valve lifters from the cylinder block and place them in a rack so that they may be installed in their original bore. It is not necessary to remove the baffle plate from the valve push rod chamber floor to remove the valve lifters. The internal part of each hydraulic valve lifter assembly are matched sets. Do not intermix the parts. Keep the assemblies intact until they are to be cleaned.
4. Carefully remove the camshaft by pulling it toward the front of the engine.

INSTALLATION

1. Oil the camshaft and apply Lubriplate to the lobes, then carefully slide it through the bearings.
2. Install the hydraulic valve lifters in the bores from which they were removed. Install the baffle plate if it was removed.
3. Install the intake manifold, timing chain and sprockets, cylinder front cover, and the crankshaft damper, following the procedures in this section.
4. Install the radiator, the radiator supply tank, and the hood. Fill and bleed the cooling system. Fill the crankcase with the proper grade and quantity of engine oil.
5. Start the engine and adjust the ignition timing. Operate the engine at fast idle and check all hose connections and gaskets for leaks.

HYDRAULIC VALVE LIFTER REPLACEMENT

To remove one or all of the hydraulic valve lifters:
1. Remove the air cleaner.

If all the lifters are to be removed, or if a lifter on the right bank of the engine is to be removed, remove the choke heat tube.
2. Disconnect the spark plug wires at the plugs, and remove the rocker arm cover(s) and gasket(s).
3. Remove the valve rocker arm shaft assembly by following steps 9 thru 12 under “Intake Manifold and Distributor” on page 1-25.
4. Remove the valve lifters through the push rod openings with a magnetic lifter (Fig. 57).
5. Install the new valve lifter(s) through the push rod opening with a magnetic lifter.
6. Install the push rods in their original bores.
7. Install the valve rocker arm shaft assembly by following steps 10 thru 14 under “Intake Manifold and Distributor” on page 1-35.
8. Install the valve rocker arm cover(s) and gasket(s). Install the choke heat tube if it was removed. Connect the spark plug wires and install the air cleaner.

The preceding procedure can not be used if the hydraulic valve lifters are stuck in their bore by excessive varnish, etc. In this case, it will be necessary to remove the intake manifold following the procedure in this section. After the intake manifold has been removed, remove the hydraulic valve lifter with the tool shown in Fig. 17.

**FLYWHEEL REMOVAL**

1. Disconnect the transmission from the engine and slide it to the rear as outlined in Group 5 (manual-shift transmission) or Group 6 (automatic transmission).

2. On a manual-shift transmission, mark the pressure plate cover and flywheel to facilitate assembly, then loosen the cover to flywheel bolts evenly to release the pressure plate spring tension. Remove the pressure plate and cover assembly.

3. Remove the flywheel retaining bolts and remove the flywheel.

**INSTALLATION**

1. Install the flywheel on the crankshaft flange and install the retaining bolts. Tighten the bolts in sequence across from each other to specifications.

2. On a manual-shift transmission, install the pressure plate and cover assembly on the flywheel, and start the cover bolts. Use tool 7563 to align the clutch disc, and then evenly tighten the cover bolts to specifications.

3. Connect the transmission to the engine as outlined in Group 5 (manual-shift transmission) or Group 6 (automatic transmission).

**OIL FILTER REPLACEMENT**

1. Place a drip pan under the filter. Unscrew the filter from the adapter fitting. Clean the adapter filter recess.

2. Coat the gasket on the new filter with oil, and place the filter in position on the adapter (Fig. 58). Hand tighten the filter until the gasket contacts the adapter face, then advance it 1/2 turn.

3. Operate the engine at fast idle and check for leaks. If oil leaks are evident, perform the necessary repairs to correct the leakage. Check the oil level and fill the crankcase if necessary.

**OIL PAN AND OIL PUMP REMOVAL**

1. Drain the cooling system and the crankcase. Disconnect the radiator upper hose at the radiator supply tank.

2. Remove the oil pan retaining screws and lower the oil pan to the underbody cross member. Position the crankshaft so that the counterweight will clear the oil pan and move the pan forward.

3. Remove the coil retaining bolts and position the coil out of the way.

4. Install the engine lifting brackets and sling. Raise the engine high enough to place tension on the engine mounts.

5. Remove the engine front insulator to engine retaining bolts. Raise the engine high enough to permit removal of the oil pump retaining bolts, then remove the bolts. Remove the oil pan and the oil pump.

**INSTALLATION**

1. Raise the engine high enough to allow installation of the oil pump and the oil pan. Position a new gasket on the oil pump housing and on the oil pan. Place the oil pump in the oil pan and position the oil pan on the underbody cross member. Insert the oil pump drive shaft into the oil pump housing and install the oil pump and shaft as an assembly. Do not attempt to force the pump into position if it will not seat readily. The drive shaft hex may be misaligned with the distributor shaft. To align, rotate the intermediate shaft into a new position. Tighten the oil pump retaining screws to specifications.

2. Hold the oil pan in place against the cylinder block and install a retaining screw on each side of the oil pan. Install the remaining screws and tighten them, from the center outward, to specifications.

3. Lower the engine, then install the engine right and left front support retaining bolts. Tighten the bolts to specifications. Remove the engine lifting bracket and sling. Install the coil and connect the radiator upper hose. Fill the cooling system. Fill the crankcase with the proper grade and quantity of engine oil. Operate the engine and check for leaks.
The Thunderbird 430 Special V-8 engine (Fig. 1) has a 4.30-inch bore and a 3.70-inch stroke and a total piston displacement of 430 cubic inches. It has a compression ratio of 10.0:1. The patent plate symbol for the engine is "J.”

**MANIFOLDS**

The intake manifold is water heated to assist in vaporizing the incoming fuel charge. The water passages are located beneath the fuel passages. Refer to "Cooling System" in this section for a description of the water circulation through the manifold.

The intake manifold has two sets of fuel passages, each with its own separate inlet connection to the carburetor (Fig. 2). The right side of the carburetor feeds Nos. 1, 4, 6 and 7 cylinders and the left side feeds Nos. 2, 3, 5, and 8 cylinders.

**CYLINDER HEADS**

The cylinder head assemblies contain the valves and the valve rocker arm shaft assembly. Valve guides are an integral part of the head. The valve ports (Fig. 3) are water jacketed and are arranged so that no two exhaust valves are adjacent. The valves are arranged from front to rear on the right bank 1-E-1-E-1-E-1-E, and on the left bank E-1-E-1-E-1-E.

**CYLINDER BLOCK**

The combination oil and vacuum pump is mounted in the engine block.
